Front-End Knowledge Measuring Task

MINIMUM CRITERIA

Create a page from zero, based on https://www.bestjobs.eu/en/ fully functional with dummy data, using the latest front-end technologies available (HTML5, CSS3, ES6, etc.). You can freely choose any tool or technology, but make sure to be the latest available. Make sure the page is working and looks the same on every browser (IE 10+).

EXTRA: make the page fully responsive

MEDIUM LEVEL

Use Bootstrap 4, Fontawesome and develop an infinite scroll effect for cards (when you scroll to the bottom of the page automatically load the next set of job cards via AJAX).

EXTRA: show job detail in modal with possibility to navigate forward and backward between jobs.

ADVANCED LEVEL

Configure and use Webpack to minify and combine JS files, compile SCSS. Using any other capability of Webpack considered as a plus.

EXTRA: setup a minimal Symfony project and use Twig as templating language for this page. Eventually you can create a GIT repository and upload the project there.

EXPERT LEVEL

Use any of the modern JS frameworks like React, Vue,js, Angular, etc.

EXTRA POINTS

Feel free to make any improvements for a better look, better UX. In this case provide a small description what and why you changed.
